Received 19 May 1982
Integral form of the LeChatelier-Shreder equation derived for different forms of temperature dependence of $\Delta C_{p}$ is presented. The temperature dependence may be given either by a functional relationship or by the table of values. If the functional relationship is chosen, then it is recommended to use a polynomial in difference of temperatures from the melting point instead of a polynomial in absolute temperature. In practical applications the former procedure is better founded.

#### Abstract

В работе приведен интегральньй вид уравнения ЛеШателье - Шредера для различньх типов температурной зависимости $\Delta C_{p}$ : как для функционально заданной, так и для заданной в виде таблицы. В случае функциональной зависимости предложена степенная формула, в которой, однако, используется не абсолютная температура, а разность от температуры плавления. Этот способ более обоснован для практического использования.

Phase equilibrium solidus-liquidus is described by the LeChatelier-Shreder equation the differential form of which is presented by Malinovský [1]

$$
\begin{equation*}
\mathrm{d} \ln a=\frac{\Delta H^{1 / s}}{R T^{2}} \mathrm{~d} T \tag{1}
\end{equation*}
$$

where $a$ is the activity of component in liquid phase, $\Delta H^{1 / 5}$ is the enthalpy of phase transition solidus-liquidus, $R$ is gas constant, and $T$ is absolute temperature.

Integral form of the LeChatelier-Shreder equation can be obtained by integration of eqn (1) in limits ( $T, T_{\mathrm{f}}$ )

$$
\begin{equation*}
\ln a=-\frac{1}{R} \int_{T}^{T_{\mathrm{t}}} \frac{\Delta H^{1 / \mathrm{s}}}{T^{2}} \mathrm{~d} T \tag{2}
\end{equation*}
$$

(At $T=T_{\mathrm{f}}$ the activity of pure component equals one.) By integration of the right side of eqn (2) the following cases can occur:

1. $\Delta H^{1 / s}=$ const $=\Delta H^{t}$ (it does not depend on temperature). Then the integration (2) yields the simplest form of the LeChatelier-Shreder equation

$$
\begin{equation*}
\ln a=\frac{\Delta H^{t}}{R}\left(1 / T_{\mathrm{f}}-1 / T\right) \tag{3}
\end{equation*}
$$

2. $\Delta H^{1 / s}$ depends on temperature according to Kirchhoff's relation

$$
\begin{equation*}
\mathrm{d}\left(\Delta H^{1 / s}\right)=\Delta C_{p}^{1 / s} \mathrm{~d} T \tag{4}
\end{equation*}
$$

but $\Delta C_{p}^{1 / s}$ is constant. Integrating eqn (4) in limits ( $T, T_{\mathrm{f}}$ ) gives

$$
\begin{equation*}
\Delta H^{1 / s}=\Delta H^{1}-\Delta C_{P}^{1 / s}\left(T_{\mathrm{f}}-T\right) \tag{5}
\end{equation*}
$$

and finally by integration of eqn (2) we obtain

$$
\begin{equation*}
\ln a=\frac{\Delta H^{\mathrm{f}}}{R}\left(\frac{1}{T_{\mathrm{f}}}-\frac{1}{T}\right)+\frac{\Delta C_{p}}{R}\left(\frac{T_{\mathrm{f}}}{T}-1-\ln \frac{T_{\mathrm{f}}}{T}\right) \tag{6}
\end{equation*}
$$

3. $\Delta C_{p}^{1 / s}$ is an arbitrary function of temperature. Then it holds

$$
\begin{equation*}
\ln a=\frac{\Delta H^{t}}{R}\left(\frac{1}{T_{\mathrm{f}}}-\frac{1}{T}\right)+\frac{1}{R} \int_{T}^{T_{\mathrm{t}}}\left[\frac{1}{T^{2}} \int_{T}^{T_{\mathrm{t}}} \Delta C_{p}^{1 / \mathrm{s}} \mathrm{~d} T\right] \mathrm{d} T \tag{7}
\end{equation*}
$$

4. The temperature dependence of $\Delta C_{p}^{1 / 5}$ is given as a polynomial in $T$, e.g.

$$
\begin{equation*}
\Delta C_{p}^{1 / s}=a+b T+c T^{-2} \tag{8}
\end{equation*}
$$

Double integration of eqn (7) gives in this case

$$
\begin{equation*}
\frac{1}{R}\left\{a\left(\frac{T_{\mathrm{t}}}{T}-1-\ln \frac{T_{\mathrm{t}}}{T}\right)+\frac{b}{2}\left(\frac{T_{\mathrm{f}}^{2}}{T}-2 T_{\mathrm{t}}+T\right)+\frac{c}{2}\left(\frac{1}{T}-\frac{1}{T_{\mathrm{t}}}\right)^{2}\right\} \tag{9}
\end{equation*}
$$

The last temperature dependence of $\Delta C_{p}$ is most frequently used for the description of heat capacities of solid and liquid substances. However, at the melting point, there is a discontinuous change in the heat capacity from $C_{p}^{\circ}$ to $C_{p}^{1}$. Therefore it is more convenient and more advantageous to express $\Delta C_{p}$ not as a polynomial in $T$ (as in the case of eqn (8)) but in the difference ( $T_{i}-T$ ).
Thus

$$
\begin{equation*}
\Delta C_{p}^{1 / s} / R=\sum_{k=1}^{m} a_{k}\left(T_{\mathrm{f}}-T\right)^{n_{k}} \tag{10}
\end{equation*}
$$

where $n_{k}$ can be any nonnegative integer. For $n_{1}=0 a_{1}$ is identical with $\Delta C_{p}^{1 / s} / R$ at $T_{\mathrm{f}}$.

If we put eqn (10) into eqn (7) we obtain the final form of the LeChatelier-Shreder equation

$$
\begin{equation*}
\ln a=\frac{\Delta H^{t}}{R}\left(\frac{1}{T_{\mathrm{t}}}-\frac{1}{T}\right)+\sum_{k=1}^{m} a_{k} K_{k} \tag{11}
\end{equation*}
$$

The terms $a_{k} K_{k}$ denote the contributions to $\ln a$ corresponding to powers $n_{k}$ in eqn (10). $K$ (it is further written without index $k$ ) replaces the double integral corresponding to power $n$

$$
\begin{equation*}
K=\int_{T}^{T_{t}}\left[\frac{1}{T^{2}} \int_{T}^{T_{t}}\left(T_{\mathrm{f}}-T\right)^{n} \mathrm{~d} T\right] \mathrm{d} T \tag{12}
\end{equation*}
$$

Solving this integral we obtain the following expression for $K$

$$
\begin{equation*}
K=-T_{i}^{n} \ln \left(\frac{T_{\mathrm{f}}}{T}\right)+\frac{T^{n}}{n+1}\left(\frac{T_{\mathrm{f}}}{T}-1\right) \cdot \sum_{i=1}^{n+1} b_{i}\left(\frac{T_{\mathrm{i}}}{T}\right)^{n+1-i} \tag{13}
\end{equation*}
$$

where

$$
b_{i}=c_{i}+\sum_{j=i+1}^{n+1} c_{j} \quad\left(\text { for } i=1, b_{1}=1\right)
$$

and

$$
c_{i}=(-1)^{i}\binom{n+1}{i} /(i-1) \quad i=2,3, \ldots, n+1
$$

We shall briefly describe the procedure for application of the derived relations:
a) We calculate the binomial coefficients $\binom{n+1}{i}$ for given $n$.
b) The result is divided by $(i-1)$.
c) Alternation of sings gives the coefficients $c_{i}$.
d) Summation of the coefficients $c_{i}$ gives the coefficients $b_{i}$.
e) For given $T$ and $T_{\mathrm{f}}, K$ corresponding to chosen $n$ is calculated according to eqn (13).
f) Similar procedure is applied also for other powers.
g) $\ln a$ is calculated according to eqn (11).

For a more convenient use of this procedure the coefficients $b_{i}$ were calculated for $n$ ranging from 0 to 7 and they are presented in Table 1. They correspond to the fractions the denominator of which is for given $n$ the same (it is written in the second column of the table).

Table 1. Values of coefficients $b_{i}$ in eqn (13) $\quad\left(b_{i}=B_{i} / J\right)$

| $n$ | J | $B_{1}$ | $B_{2}$ | $B_{3}$ | $B_{4}$ | $B_{5}$ | B6 | $B_{7}$ | $B_{8}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 1 | 1 |  |  |  |  |  |  |  |
| 1 | 1 | 1 | 1 |  |  |  |  |  |  |
| 2 | 2 | 2 | 5 | - 1 |  |  |  |  |  |
| 3 | 6 | 6 | 26 | - 10 | 2 |  |  |  |  |
| 4 | 24 | 24 | 154 | - 86 | 34 | - 6 |  |  |  |
| 5 | 120 | 120 | 1044 | - 756 | 444 | - 156 | 24 |  |  |
| 6 | 720 | 720 | 8028 | - 7092 | 5508 | - 2892 | 888 | - 120 |  |
| 7 | 5040 | 5040 | 69264 | -71856 | 69264 | -48336 | 22224 | $-6000$ | 720 |

As an example of application of the relation (13) we present the simplest case of temperature dependence of $\Delta C_{p}, v i z . \Delta C_{p}$ is constant ( $n_{1}=0$ ). Then

$$
K_{\mathbf{l}}=-\ln \left(T_{\mathrm{f}} / T\right)+\left(T_{\mathrm{f}} / T-1\right)
$$

For $n_{2}=1$ the relation (13) leads to the expression

$$
K_{2}=-T_{\mathrm{f}} \ln \left(T_{\mathrm{f}} / T\right)+T_{\mathrm{f}} / 2 \cdot\left(T_{\mathrm{f}} / T-1\right) \cdot\left(T_{\mathrm{f}} / T+1\right)
$$

Therefore if $\Delta C_{p}$ is a linear function of temperature,

$$
\Delta C_{P}=a_{1}+a_{2}\left(T_{\mathrm{t}}-T\right)
$$

and then

$$
\ln a=\Delta H_{\mathrm{t}} / R\left(1 / T_{\mathrm{t}}-1 / T\right)+a_{1} K_{1}+a_{2} K_{2}
$$

Sometimes the temperature dependence of $\Delta C_{p}$ is not given by a functional relationship but in the form of table of values. It can hapen that we do not wish or cannot approximate these values by a functional relationship. We encountered this in the case of $\Delta C_{p}$ of water [2] where initial steep increase of $\Delta C_{p}$ observed by undercooling changes after exceeding temperature of homogeneous nucleation to decrease of heat capacity. Description of such a dependence of $\Delta C_{p}$ by a continuous functional relationship is rather difficult (the polynomial (10) requires high powers). It seems to be better to solve the integration in eqn (7) not analytically but numerically. For this purpose it is convenient to rearrange eqn (7) in the following way

$$
\begin{equation*}
\ln a=\frac{\Delta H_{f}}{R}\left(\frac{1}{T_{\mathrm{f}}}-\frac{1}{T}\right)+\frac{1}{R}\left\{\frac{1}{T} \int_{T}^{T_{1}} \Delta C_{p} \mathrm{~d} T-\int_{T}^{T_{\mathrm{t}}} \Delta C_{p} \mathrm{~d} \ln T\right\} \tag{14}
\end{equation*}
$$

Then we can use one of the methods suitable for calculation of definite integrals (rectangular or trapezoidal or Simpson's rule, etc.). If the data are spaced unequally, we can use a procedure corresponding to the trapezoidal rule

$$
\begin{equation*}
K=\left(\sum_{i=0}^{n}\left(C_{i}+C_{i+1}\right) \cdot\left(T_{i}-T_{i+1}\right)-\sum_{i=0}^{n}\left(C_{i}+C_{i+1}\right) \cdot \ln \left(T_{i} / T_{i+1}\right)\right) / 2 \tag{15}
\end{equation*}
$$

where $K$ is the value of difference of both integrals in eqn (14) and $C_{i}$ are the values of $\Delta C_{p}$ at temperatures $T_{i}$. Index zero corresponds to melting temperature and the last index ( $n$ ) to the temperature $T$ (lower integration limit).

Both the methods proposed for calculation of values of integral in the LeChatelier - Shreder equation can be applied to solution of practical problems and they offer special advantages when computers are used.
